Practice workbook · Explain how beta-blockers and ACE inhibitors lower heart rate or pressure

Mechanisms and effects of beta-blockers, ACE inhibitors and related receptor blockers.

6 question parts: 1 worked-example retry and 5 further practice parts.
Name: _____ Class: _____ Date: _____

Practise one question type at a time. Attempt the part inside the red boundary; the rest of the question and any figures are kept for context. Write your working in the answer space.

The first question is a retry of the website worked example, without its solution. Check your answers online with 'Check my answer', or ask your teacher for the answer booklet.

1. Question 7 · part c · 3 marks

June 2024 Paper 2

Worked-example retry · Attempt part c only.

7 (a) The diagram shows a fatty deposit in an artery carrying blood to the heart muscle.

(Source: adapted from https://www.heartandstroke.ca/heart-disease/conditions/atherosclerosis)

Explain how a build-up of a fatty deposit in an artery carrying blood to the heart muscle can cause heart disease.

(b) People with obesity are more at risk of heart disease than those who are overweight.

The chart shows the percentage of men and women in the United Kingdom who were either overweight or obese in 2018.

(Source: https://digital.nhs.uk/data-and-information/publications/statistical/health-survey-for-england/2018/summary)

(i) In 2018 there were 66.5 million people living in the UK. Of these people, 33 million were men.

Calculate how many more women than men were classified as obese.

(3)

extra number of women = ...

January 2020 Paper 1

Further practice · Attempt part a.i only.

9 In sports such as archery and shooting, beta-blockers are used illegally by some competitors to help reduce the effects of stress and anxiety, which can affect performance.

(a) (i) Suggest why the use of beta-blockers in competitive sport is illegal.

(1)

(ii) Stress and anxiety can cause an increase in the release of adrenaline.

Explain the effects of adrenaline on the body.

June 2025 Paper 2

Further practice · Attempt part a only.

5 Read the passage below.

Use the information in the passage and your own knowledge to answer the questions that follow.

Losartan belongs to a group of drugs known as angiotensin-II receptor antagonists. The body produces angiotensin-II, which is a substance that binds to receptors in blood vessels, causing them to narrow. This causes an increase in blood pressure. Losartan prevents angiotensin-II binding to these receptors, lowering blood pressure.

If high blood pressure is left untreated, a decrease in kidney function can result in proteinuria. This is a condition that causes high levels of protein to be found in a person's urine. People with high blood pressure and a resultant thickening of the left ventricle can be treated with Losartan to reduce the risk of stroke.

People with high blood pressure should not take Losartan if their liver is not functioning properly. Women who are pregnant or who are breast feeding should not take Losartan.

(a) Describe how the action of Losartan differs from the action of an ACE inhibitor. (lines 4 and 5)
