# Practice workbook · State the role of a named reproductive hormone

Functions of FSH, LH, oestrogen, progesterone and testosterone in the cycle or development.

6 question parts: 1 worked-example retry and 5 further practice parts.
Name: _____ Class: _____ Date: _____

Practise one question type at a time. Attempt the part inside the red boundary; the rest of the question and any figures are kept for context. Write your working in the answer space.

The first question is a retry of the website worked example, without its solution. Check your answers online with 'Check my answer', or ask your teacher for the answer booklet.

**1** (a) The words in the box give the names of some of the parts of the male and female reproductive systems.

| | | | |
|---|---|---|---|
| epididymis | ovary | oviduct | seminal vesicle |
| testes | uterus | urethra | vagina |
| vulva | | | |

Complete the table by giving the name of the part that matches the description.

**(7)**

| Description | Name of part |
|---|---|
| duct that carries urine and sperm | |
| produces sperm | |
| where fertilised ovum is implanted | |
| produces the fluid part of semen | |
| where sperm is deposited during intercourse | |
| where fertilisation happens | |
| releases ova | |

(b) Oxytocin and LH (luteinising hormone) are two hormones found in females.

(i) Describe the functions of oxytocin.

**(3)**

.....

.....

.....

.....

(ii) Describe the functions of LH.

January 2020 Paper 1

Further practice · Attempt part a.iii only.

(iii) The ovaries produce female sex hormones.

The box lists words associated with the female reproductive system.

| | | | | |
|---|---|---|---|---|
| FSH | wall | fertilisation | oestrogen | ovulation |
| lining | ADH | follicles | menstruation | |

Use words from the box to complete the passage about the ovaries.

**(3)**

The ovaries produce a hormone called ..... .

This hormone repairs the uterus ..... following menstruation. Once a month, one egg is released from the ovaries. This is known as ..... .

(b) State why a pregnant female should have more calcium in her diet than a female who is not pregnant.

**(1)**

.....

.....

(c) Some women breastfeed their babies.

Give one advantage of breastfeeding babies rather than feeding them bottled milk.

# 4. Question 6 · part f · 1 mark

June 2023 Paper 2R

Further practice · Attempt part f only.

**6** Read the passage below.

Use the information in the passage and your own knowledge to answer the questions that follow.

Pregnancy begins with the formation of a zygote. This stage is known as conception. The zygote develops into an embryo. By day five the embryo is transformed into a blastocyst, a hollow ball of about 100 genetically identical cells. These cells have not yet differentiated and they can provide a source of embryonic stem cells for use in medical research. Embryos produced following IVF treatment can be used as a source of embryonic stem cells.

In the second week following conception, the blastocyst begins the process of implantation and releases a hormone, called hCG. This hormone maintains the corpus luteum, a structure formed in the ovary following ovulation. After implantation the amniotic sac forms, which is where the blastocyst and later the fetus develop.

In the fourth and fifth week after conception, the umbilical cord forms. This connects the embryo to the placenta by week eight. The placenta is not fully developed until week ten when it begins to produce progesterone and oestrogen. All organ systems are present at this time in pregnancy.

Fetal development begins at about month four and it is possible to distinguish males from females at this time. In males the testes, which develop in the abdominal cavity, release testosterone. Female characteristics are produced in the fetus if testosterone is not released at the stage.

Hormones are important in starting labour and the birth process, about nine months after conception. The cervix dilates, with the head of the baby pushing against the cervix to help the process of dilation. Once the child is born and breathing normally, the umbilical cord is tied and cut, separating the child from the placenta.

(a) Describe the process that occurs at conception. (lines 1 and 2)

(b) Describe the process that forms a blastocyst. (lines 2 to 4)

**(4)**

OLevels.com SCHOOL

(c) Which is a reason why cells taken from a blastocyst can be useful in scientific research?

**(1)**

- ☒ **A** the cells are already differentiated
- ☒ **B** the cells are able to differentiate into both sex cells and body cells
- ☒ **C** the cells are able to differentiate into any type of sex cell
- ☒ **D** the cells are able to differentiate into any type of body cell

## 4. Question 6 · part f · 1 mark

June 2023 Paper 2R

Further practice · Attempt part f only.

(d) Explain why it is important that hCG maintains the corpus luteum. (lines 7 to 9)

**(2)**

(e) Explain the importance of the development that takes place in the fourth and fifth week after conception. (lines 12 and 13)

**(2)**

OLevels.com SCHOOL

(f) Suggest the role of testosterone in the development of the fetus. (lines 17 to 19)

**(1)**

(g) Which change occurs during the birth process? (line 20)

**(1)**

- ☒ **A** oestrogen levels decrease
- ☒ **B** progesterone levels increase
- ☒ **C** release of oxytocin from the pituitary gland
- ☒ **D** release of hCG from the placenta

Further practice · Attempt part a only.

**6** (a) The table gives the names and functions of hormones in the menstrual cycle.

Complete the table by placing one tick (✓) in each row of the table to show the main function of each hormone in the menstrual cycle.

**(3)**

| Hormone | Function of hormone | | | |
|---|---|---|---|---|
| | causes ovulation | builds up uterus lining after menstruation | maintains uterus lining during pregnancy | stimulates a follicle to mature |
| progesterone | | | | |
| FSH | | | | |
| oestrogen | | | | |

(b) The chance of pregnancy can be decreased by using contraception.

State **one** method of barrier contraception.

**(1)**

.....

(c) In-vitro fertilisation (IVF) can be used to increase the chances of pregnancy.

Describe the process of IVF.

June 2024 Paper 2R

Further practice · Attempt part a.iv only.

(iii) Fertilisation takes place in the female reproductive system.

Which of these describes fertilisation?

**(1)**

- ☒ **A** a sperm cell fuses with an egg cell to form a haploid cell
- ☒ **B** a sperm cell fuses with an egg cell to form an embryo
- ☒ **C** a sperm cell fuses with an egg cell to form a zygote
- ☒ **D** a sperm cell fuses with an egg cell to form a baby

(iv) Before fertilisation can take place, ovulation needs to occur.

Name the hormone that causes ovulation.
